

## Correlation

Paired data can be plotted as a scatter plot

Each dot is a specific person

Correlation is "how close is this to a straight line"

Correlation between (r)  
 $[-1, 1]$

$$r = 1$$

$r = -1$  any neg slope  
perfect straight line

$r=0$ , no linear relation

.

.

Computing  $\text{cor}(x, y)$

Easiest way  $\text{cor}(x, y)$  in R.

x	y
$x_1$	$y_1$
$x_2$	$y_2$
$\vdots$	$\vdots$
$x_n$	$y_n$

1. Convert each column to  $SV$   
(with their respective mean  
and  $sd$ )

2. multiply element wise  
to get new vector

$$\frac{z}{su(x_1) \cdot su(y_1)}$$

$\vdots$

$$su(x_n) \cdot su(y_n)$$

3. Take average of  $z$ .

Properties

adding a constant doesn't  
change  $r$

multiplying by (+) constant  
doesn't change  $r$ .

any "linear" transform

$ax + b$  for  $a \neq 0$

won't change  $r$

multiplying by  $(-)$  constant  
flips sign of  $r$ .

$$\text{cor}(x, y) = \text{cor}(y, x)$$
